Chicago Traffic Crashes reported tra

Chicago Crash Browser updates with stats, fil- ters, and news article links

AUGUST 9, 2022 / STEVEN VANCE / 0 COMMENTS

Today I'm adding a bunch of new features to the [Chicago Crash Browser](#), which lives on Chicago Cityscape.

But first...special access is no longer required. [Anyone can create a free Cityscape account](#) and access the map. However, only those with [special access](#) or a Cityscape Real Estate Pro account will be able to download the data.

Five new features include:

- Statistics that update weekly to summarize what happened in the past week: the number of crashes, the number of people killed in crashes, and the number of people with the two worst tiers of injuries. The statistics are [viewable to everyone](#), including those without access to the crash browser.

Crashes last week

Between Sunday, 7/31/2022, and Saturday, 8/06/2022, there were 1,826 reported traffic crashes in Chicago.

Many people were reported killed or injured:

- 4 people were killed
- 53 people had incapacitating injuries
- 230 people had non-incapacitating injuries

ⓘ If looking at these stats on the day following the end of the period (i.e. Sunday, after the Saturday of the last week): Yesterday's reports may not yet be completely uploaded. The stats in this section are recalculated every 12 hours to account for newly uploaded crash reports.

Crashes in the previous week

Between Sunday, 7/24/2022, and Saturday, 7/30/2022, there were 1,837 reported traffic crashes in Chicago.

Many people were reported killed or injured:

- 3 people were killed
- 54 people had incapacitating injuries
- 271 people had non-incapacitating injuries

The statistics will update every Sunday. The numbers may change throughout the week as Chicago police officers upload crash reports.

- For data users, the crash record ID is viewable. The crash record ID links details about the same crash across the Chicago data portal's three tables: Crashes, Vehicles, and People. My Chicago Crash Browser is currently only using the Crashes table. Click on the "More details" arrow in the first table column.

Report # (RD No.)	Most severe injury	Address	Crash type	Crash date
[not created]				
▼ More details				
Crash Record ID: d772d78e324abd01b4c5e08b98981f8b01e08eb13e8ca84eb8da4fa281349f04db9407e28905ef4e8ddd1548df6a7114e584f390bd3da15dee028f0c5caedee3				
[not created]				
► More details				

The crash record ID is hidden by default but can be exposed. Use this ID to locate details in the data portal's Vehicles and People tables.

- Filter crashes by location. There are currently two location filters: (1) on a "Pedestrian Street" (a zoning designation to, over time, reduce the prevalence of car-oriented land uses and improve building design to make them more appealing to walk next to); (2) within one block of a CTA or Metra station, important places where people commonly walk to. Select a filter's radio button and then click "Apply filters".

- Filter crashes by availability of a *news article* or a *note*. I intend to attach news articles to every crash where a pedestrian or bicyclist was killed (the majority of these will be to Streetsblog Chicago articles, where I am still “editor at large”). Notes will include explanations about data changes [1] (the “map editor” mentioned in some of the notes is me) and victims’ names.

Location filters

☒ All crashes (default)

☐ On a "Pedestrian Street"

☐ Within 1 block of a CTA or Metra station

News or notes

☒ All crashes (default)

☐ Has a news article

☐ Has a note

☐ Has a news article or note

 Apply filters

After choosing a filter’s radio button click “Apply filters” and the map and data table will update.

- Filter by hit and run status. If the officer filling out the crash report marked it as a hit and run crash, you can filter by choosing “Yes” in the options list. “No” is another option, as is “not recorded”, which means the officer didn’t select yes or no.
- Search by address. Use the search bar inside the map view to center the map and show crashes that occurred within one block (660 feet) of that point. The default is one block and users can increase that amount using the dropdown menu in the filter.

Use the search bar within the map view to show crashes near a specific address in Chicago.

Footnotes

[1] The most common data change as of this writing is when a crash’s “most severe injury” is upgraded from non-fatal to fatal, but the crash report in the city’s data portal does not receive that update. This data pipeline/publishing issue is described in the browser’s “Crash data notes” section.

The “map editor” (me) will change a crash’s “most severe injury” to fatal to ensure it appears when someone filters for fatal crashes. This change to the data will be noted.
