

9.7 degrees

How much hotter NYC is for the average resident due to the city's tall buildings, little tree cover and lots of cars and buses.

It is the largest per capita temperature boost in the U.S.

gothamist There's a reason many New Yorkers flee the city in the summer — and it's not just the call of the beaches.

Densely populated urban areas with tall buildings, little tree cover and lots of cars and buses tend to be hotter than rural environments, a phenomenon called the "urban heat island" effect.

A new study finds that the average New Yorker feels this effect more than anyone else in the country.

How much excess heat does your neighborhood have? Head to our link in bio to check out our interactive map.
