

FINDINGS

Does the use of the solid green marking prompt motorists to respect the bicycle lane (reducing encroachments) as well as be more aware of cyclists along the roadway?

NYCDOT data indicates that the green paint treatment resulted in fewer instances of drivers encroaching on the bike lane by driving on the bike lane boundary line. Overall, 7% of drivers on the green paint treated streets drove on the bike lane boundary line as opposed to 16% of drivers on streets with the typical non-painted bike lane treatment. The data also showed fewer instances in driving in the bike lane; on average, 4% of drivers drove in the bike lane on green paint treated streets as opposed to 7% of typical streets. The frequency of standing or parking in the bike lane between the two different paint treatments was comparable.

Driver behavior—the likelihood of drivers driving in the bike lane—did not seem to be influenced by the presence of cyclists in either lane type. On average, cyclists riding in the lane found it unobstructed in 96% of the cases on green paint treated lanes as opposed to 93% of cases on the typical non-painted lanes.
